

Create a web page for your personal profile. The page should have three sections:

1. The first section (which should also be the main section ("index.html"/home section)) should contain information about yourself: name, date of birth, education, places you've lived, etc. (information that you also have on your personal Facebook page).
2. The second section should contain information about your professional work experience/education (which you also have on your LinkedIn profile).
3. Information about your hobbies/passions etc.

The page should have a clean design (of your choice) and should contain at least 3 relevant animations (done with CSS) (of your choice).

The details (name, date of birth, etc.) you expose on this page should be kept in one or multiple (at your choice) JSON objects in a javascript file. You should take that information and build the HTML document dynamically.

You can use any CSS & JS library that you want.

Evaluation criteria:

1p by default

2p if you have the 3 sub-pages (sections) with relevant information

2p for design

2p for CSS animations

3p for using JS to build the HTML document dynamically
